

Crops Well Suited to Repeated Planting

Spring

Peas – sow every two weeks as soon as soil can be worked until the end of May

Spinach – each planting can take 2-3 cuttings before going to seed

Lettuce – select heat resistant varieties for late spring plantings

Carrots – sow every two weeks until 8/1, needs consistent moisture to germinate

Onions – Plant early for storage onions, continue planting through summer for green onions.

Cabbage – red varieties mature more slowly and are less likely to split in hot weather

Chard – harvest early leaves for salad greens then allow plant to develop for cooking greens.

Beets – sow every two weeks to provide greens for cooking and salads and young, tender beets

Radishes – frequent sowings (up to every week) grow quickly to provide continuous harvest

Sweet Corn

Summer

Beans – harvest quality falls after a few pickings so plant beans every three weeks

Zucchini – early plantings often attract pest or fall to disease

Cucumbers – one planting a month will provide tender cucumbers all season

Cilantro – will go to seed after 2-3 cuttings so repeated plantings are needed

Basil – a late planting of basil replaces early plant that have gone to seed

Late Summer/Fall

Broccoli/Cauliflower – transplants can be planted out in late summer

Kale – will continue to produce through early freezing weather

Lettuce – sow through August Spinach – will produce until frozen

Radishes
